# Background

Insect decline in the Anthropocene: Death by a thousand cuts  
D.L. Wagner, E.M. Grames, M.I. Forister, M.R. Berenbaum, D. Stopak  
PNAS 2021

# Questions

- How do different temperatures affect the development and survival of an insect herbivore, both infected and not infected with JcDV?

# Questions

- How do different temperatures affect the development and survival of an insect herbivore, both infected and not infected with JcDV?
- Does viral infection and temperature interact to effect the development and survival of an insect herbivore?

# Questions

- How do different temperatures affect the development and survival of an insect herbivore, both infected and not infected with JcDV?
- Does viral infection and temperature interact to effect the development and survival of an insect herbivore?
- Is there a threshold temperature at which insect herbivores can survive with infection of the virus?

# Model Statements

$$y_i \sim \text{Bernoulli}(\mu_i)$$

Model 1:

$$\mu_i = \text{logit}^{-1}(\beta_0 + \beta_1 \text{virus}_i + \beta_2 \text{temp}_{2i} + \beta_3 \text{temp}_{3i} + \beta_4 \text{temp}_{4i})$$

Model 2:

$$\mu_i = \text{logit}^{-1}(\beta_0 + \beta_1 \text{virus}_i + \beta_2 \text{temp}_{2i} \text{virus}_i + \beta_3 \text{temp}_{3i} \text{virus}_i + \beta_4 \text{temp}_{4i} \text{virus}_i)$$

Model 3:

$$\mu_i = \text{logit}^{-1}(\beta_0 + \beta_1 \text{virus}_i + \beta_2 \text{temp}_{2i} + \beta_3 \text{temp}_{3i} + \beta_4 \text{temp}_{4i})$$

$$\beta_1 \sim \text{Normal}(-1.3, 1.5)$$

# Model 1 Results

Model 1:

Parameter	Rhat	n_eff	mean	sd	se_mean	2.5%	97.5%
alpha	1.0	12011	1.7	0.3	0.0	1.1	2.3
beta_virus	1.0	18817	-1.1	0.3	0.0	-1.6	-0.5
beta_temp2	1.0	15785	0.4	0.4	0.0	-0.4	1.2
beta_temp3	1.0	15259	-0.4	0.4	0.0	-1.1	0.4
beta_temp4	1.0	14106	-1.7	0.4	0.0	-2.5	-1.0

# Model 1 Posterior Distributions

## Model 2 Results

Model 2:

Parameter	Rhat	n_eff	mean	sd	2.5%	97.5%
alpha	1.0	28490	1.0	0.2	0.7	1.3
beta_virus	1.0	36956	0.0	1.0	-2.0	2.0
beta_temp2	1.0	33795	-0.2	0.4	-0.9	0.6
beta_temp3	1.0	34062	-0.9	0.4	-1.7	-0.2
beta_temp4	1.0	32972	-1.9	0.4	-2.7	-1.1

# Model 2 Posterior Distributions

## Model 3 Results

Model 3:

Parameter	Rhat	n_eff	mean	sd	2.5%	97.5%
alpha	1.0	12776	1.7	0.3	1.1	2.3
beta_virus	1.0	17718	-1.1	0.3	-1.6	-0.6
beta_temp2	1.0	16688	0.4	0.4	-0.4	1.2
beta_temp3	1.0	16386	-0.4	0.4	-1.1	0.4
beta_temp4	1.0	15455	-1.7	0.4	-2.5	-1.0

# Model Checking

The `loo` package is used to carry out Pareto smoothed importance-sampling leave-one-out cross-validation (PSIS-LOO) for purposes of model checking and model comparison.

- $\widehat{elpd}_{loo}$ 
  - expected log predictive density
- $\widehat{p}_{loo}$ 
  - effective number of parameters
- $looic = -2\widehat{elpd}_{loo}$ 
  - the LOO information criterion

# Model Checking

Model	$\widehat{\Delta elpd}_{loo}$	$\Delta se$	<i>looic</i>
Model 3	0.0	0.0	331.3
Model 1	-0.1	0.0	331.4
Model 2	-11.9	4.6	355.0

The compare function makes an object that contains the estimated difference of expected leave-one-out prediction errors between the two models, along with the standard error.

# Conclusions

- The highest temperature treatment group had a greater negative effect on the survival of Buckeyes than viral infection.

# Conclusions

- The highest temperature treatment group had a greater negative effect on the survival of Buckeyes than viral infection.
- There may not be a strong interaction between temperature and virus, but there might be some interaction in the lower temperature treatment groups.

# Conclusions

- The highest temperature treatment group had a greater negative effect on the survival of Buckeyes than viral infection.
- There may not be a strong interaction between temperature and virus, but there might be some interaction in the lower temperature treatment groups.
- Prior data did not really change the results, but made the posterior predictive check perform slightly better.

# Model 3

```
data {  
  int N; // Number of observations  
  real virus[N]; // Virus dummy variable (0 or 1)  
  real temp_2[N]; // Temperature dummy variable (0 or 1)  
  real temp_3[N];  
  real temp_4[N];  
  int surv[N]; // Response variable: survivorship  
}  
parameters {  
  real alpha; // Intercept  
  real beta_virus; // Coefficient for virus variable  
  real beta_temp2;  
  real beta_temp3;  
  real beta_temp4;  
}
```

# Model 3

```
model {  
  // Priors  
  alpha ~ normal(0, 1); // Prior for intercept  
  beta_virus ~ normal(-1.3, 1.5); // Prior for virus coefficient  
  // Likelihood  
  for (i in 1:N) {  
    real mu = alpha +  
              beta_virus * virus[i] +  
              beta_temp2 * temp_2[i] +  
              beta_temp3 * temp_3[i] +  
              beta_temp4 * temp_4[i]; // Linear predictor  
    surv[i] ~ bernoulli_logit(mu); // Likelihood function*  
  }  
}
```
