

Lecture 02: What sets Bayes apart?

Perry Williams, PhD

NRES 779

Bayesian Hierarchical Modeling in Natural Resources

Today

- A high elevation view of approaches for statistical inference
- Some motivation for learning
- The basic ideas of Bayesian inference

Learning Objectives

- Understand basic notation for data, parameters, and conditional distributions
- Understand fundamental difference between frequentist inference and Bayesian inference
- Understand and interpret the Bayesian credible interval vs. frequentist confidence interval

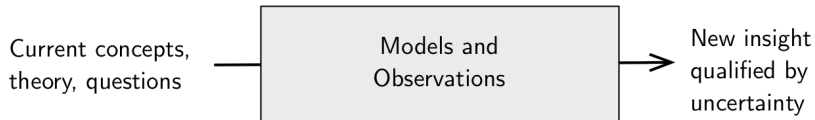

Exercise

Write the definition of a frequentist, 95% confidence interval on a parameter of interest, θ .

Exercise

In frequentist statistics, a 95% confidence interval represents an interval of a specified width such that if the experiment or sample were repeated many times, 95% of the intervals would contain the true parameter value.

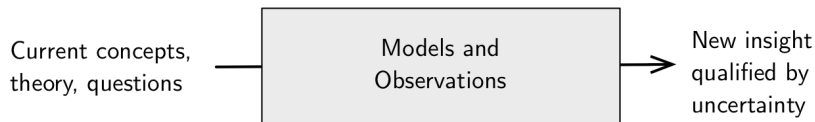

A line of inference

Some notation

- y is data
- θ a parameter or other unknown quantity of interest
- $[\theta|y]$ The probability distribution of θ conditional on y
- $[y|\theta]$ The probability distribution of y conditional on θ
- $[y|\theta] = P(y|\theta) = p(y|\theta) = f(y|\theta)f(y, \theta)$, different notation that means the same thing.

Bayesian Credible Interval

Exercise

Describe how Bayesian analysis differs from other types of statistical analyses.

What sets Bayes apart?

- Bayesians divide the world into things that are observed (y) and unobserved (θ).
- All unobserved quantities are treated as *random variables*.
- A random variable is a quantity whose behavior is governed by chance.
- Probability distributions are mathematical abstractions of “governed by chance.”
- We seek to understand the characteristics of these probability distributions, particularly $[\theta|y]$.

What sets Bayes apart?

Treating unobserved quantities as random variables is profound!

What sets Bayes apart?

All unobserved quantities are treated in exactly the same way.

- Parameters
- Latent states
- Missing data
- Censored data
- Predictions in space (interpolations)
- Predictions in time (forecasts)

Bayesian Credible Interval

An unobserved quantity (θ)

You Can Understand It

KEY TO STATISTICAL METHODS

	Design or Purpose	Measurement Variables	Ranked Variables	Attributes
1 variable 1 sample	Examination of a single sample	Procedure for grouping a frequency distribution, Box 2.1; stem-and-leaf display, Section 2.5; testing for outliers, Section 13.4 Computing median of frequency distribution, Box 4.1 Computing arithmetic mean: unordered sample, Box 4.2; frequency distribution, Box 4.3 Computing standard deviation: unordered sample, Box 4.2; frequency distribution, Box 4.3 Setting confidence limits: mean, Box 7.2; variance, Box 7.3 Computing g_1 and g_2 , Box 6.2		Confidence limits for a percentage, Section 17.1 Runs test for randomness in dichotomized data, Box 18.3
	Comparison of a single sample with an expected frequency distribution	Normal expected frequencies, Box 6.1 Goodness of fit tests: parameters from an extrinsic hypothesis, Box 17.1; from an intrinsic hypothesis, Box 17.2 Kolmogorov-Smirnov test of goodness of fit, Box 17.3 Graphic "tests" for normality: large sample sizes, Box 6.3; small sample sizes (rankit test), Box 6.4 Test of sample statistic against expected value, Box 7.4		Binomial expected frequencies, Box 5.1 Poisson expected frequencies, Box 5.2 Goodness of fit tests: parameters from an extrinsic hypothesis, Box 17.1; from an intrinsic hypothesis, Box 17.2
1 variable ≥ 2 samples	Single classification	Single classification anova: unequal sample sizes, Box 9.1; equal sample sizes, Box 9.4 Planned comparison of means in anova, Box 9.8; single degree of freedom comparisons of means, Box 14.10 Unplanned comparison of means: T-method, equal sample sizes, Box 9.9; T', GT2, and Tukey-Kramer, unequal sample sizes, Box 9.10; Welsch step-up, Box 9.11; STP test, Section 9.7; contrasts using Scheffé, T, and GT2, Box 9.12; multiple confidence limits, Section 14.10 Estimate variance components: unequal sample sizes, Box 9.2; equal sample sizes, Box 9.3 Setting confidence limits to a variance component, Box 9.3 Tests of homogeneity of variances, Box 13.1 Tests of equality of means when variances are heterogeneous, Box 13.2	Kruskal-Wallis test, Box 13.5 Unplanned comparison of means by a nonparametric STP, Box 17.5	G test for homogeneity of percentages, Boxes 17.5 and 17.8 Comparison of several samples with an expected frequency distribution, Box 17.4; unplanned analysis of replicated tests of goodness of fit, Box 17.5
	Nested classification	Two-level nested anova: equal sample sizes, Box 10.1; unequal sample sizes, Box 10.4 Three-level nested anova: equal sample sizes, Box 10.3; unequal sample sizes, Box 10.5		
	Two-way or multi-way classification	Two-way anova: with replication, Box 11.1; without replication, Box 11.2; unequal but proportional subclass sizes, Box 11.4; with a single missing observation, Box 11.5 Three-way anova, Box 12.1 More than three-way classification, Section 12.3 and Box 12.2 Test for nonadditivity in a two-way anova, Box 13.4	Friedman's method for randomized blocks, Box 13.9	Three-way log-linear model, Box 17.9 Randomized blocks for frequency data (repeated testing of the same individuals), Box 17.11

You Can Understand It

P value:

~~It is the probability~~
A number that shows the likelihood
that a value is the same as
another

Confidence Interval - ~~shows~~ A range of values
that we have a certain level of confidence
our value of interest falls in.

1) Definition of P value

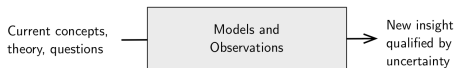

The probability of the significant
difference between measured (observed)
value & other measured values

2) What is confidence Interval?

The range of measured (observed)
value true population mean
can occur within it

You Can Understand It

- Rules of probability
 - Conditioning and independence
 - Law of total probability
 - Factoring joint probabilities
- Distribution theory
- Markov chain Monte Carlo

One Approach Tailored to Many Problems

- An unobservable state of interest, z
- A deterministic model of a process, $f(\theta, x)$ controlling the state
- A model of the data
- Models of parameters (priors)
